

control function (interprets switches and initiates/stops gate movement)

Legend

function()

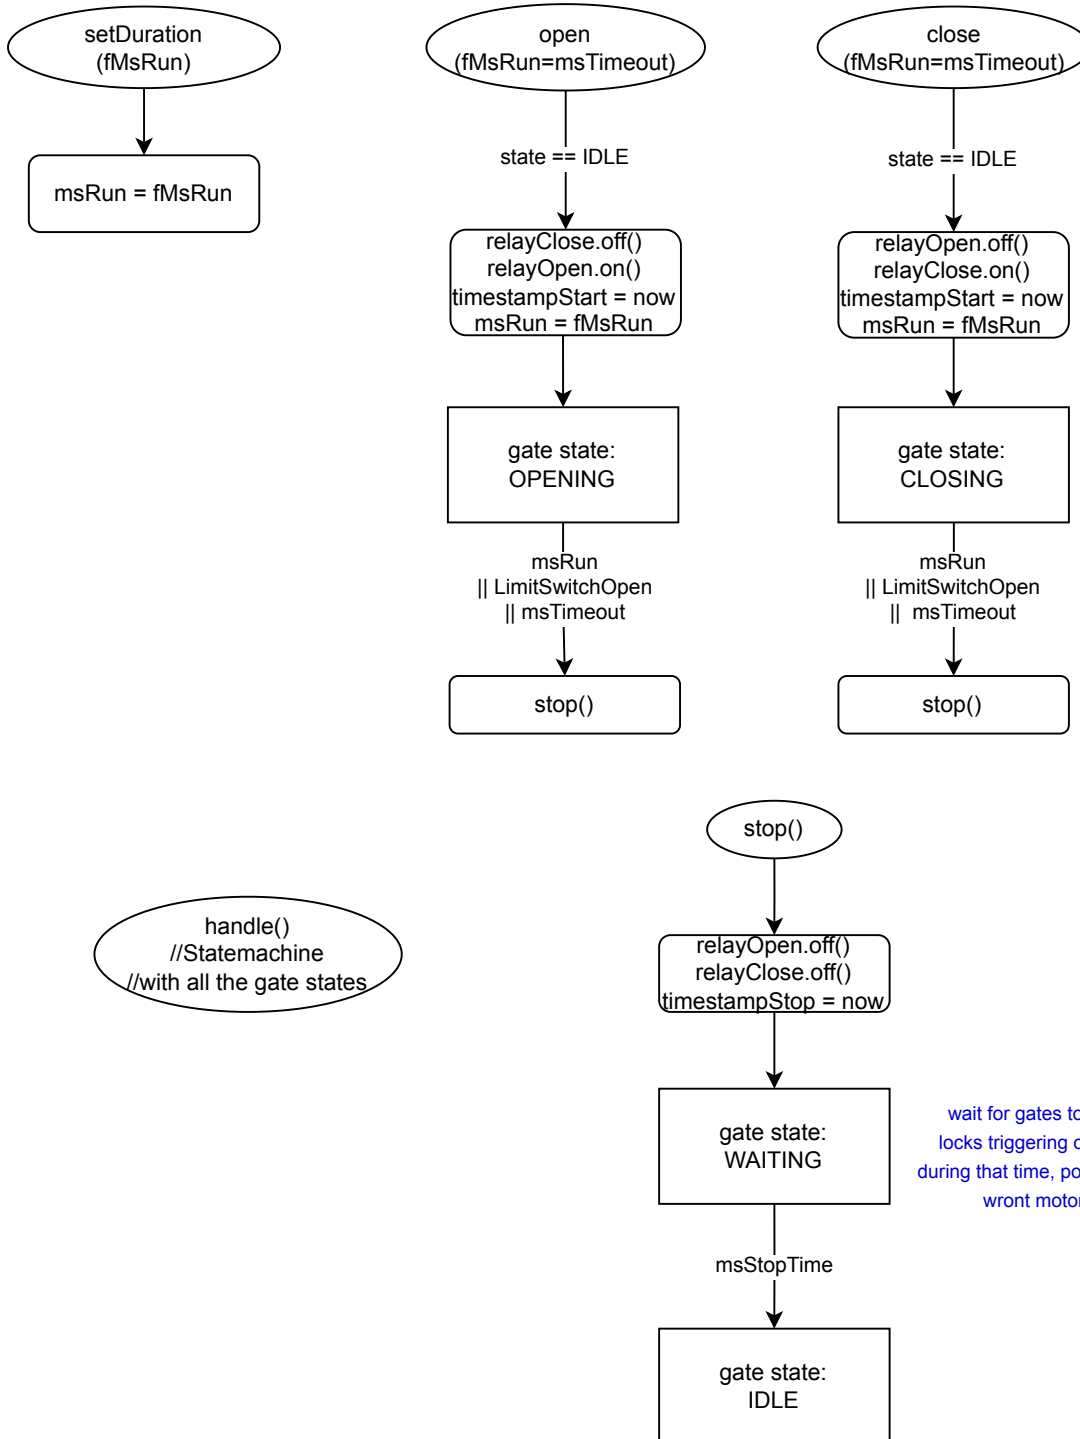

command;

STATE
of statemachine
(gets repeatedly run)

condition

if-else / switch-case

gate class (controls the relays)

TODO: Possibility to switch direction while moving
OPENING->CLOSING
(add delay for motors to stop)

handle()
//Statemachine
//with all the gate states

wait for gates to stop moving.
locks triggering other movement
during that time, possibly resulting in
wront motor direction

del - other approach
